# Stationary air conditioner for Aircraft at the airport

«When innovative solutions in ventilation/climate sector are required, then is „Seven-Air“ the right address.»

## The task

Which passenger doesn't know the unpleasant whistling noise of docked aircraft? The source of the noise is the so-called auxiliary engine. Among other things, it provides the air supply/air conditioning of the aircraft during the ground stop. In addition to the immissions, the auxiliary engines have another flaw: They burn the kerosene with an efficiency of of fourteen percent at best.

## The solution

Zurich Airport provides all docking aircraft with a cable connection and a ventilation hose. This „umbilical cord“ supplies each aircraft type with the necessary fresh air from a central air conditioning system. This system has succeeded in reducing energy consumption, noise and pollutant emissions to a minimum. A pioneer system that no airport should be without.
